

## Pixel Watch hands-on

By Isaac Maldonado

### Share this story

The renders of the pixel watch instead of attracting caused doubts and vanished the will of buying it. That's the really impressive fact when you actually have the finished product in your hand. I must say that Google with a smart move respond the clamor that many we kept doing to Apple to give us a circular Apple Watch. It's got the curved glass display, a minimalist and techy feel, a digital crown, and a flat side button. Bravo Google for that.

The new wear OS 3.5 UI is the best wearable interface Google's ever put out. I must say the bar was low, Google improved in that department. The trend this fall has been for smartwatch to go big and Google is going against this trend. I think this a positive decision of doing it with a relatively small 41mm, the petite people have their selection.

The noticeable bezels on the display that lacks of sensors on them, it is a wasted space. The dome is not made of sapphire crystal and that is a downside for the durability, so you will see the Pixel Watch filling of scratches over time. Since the product is a new branch of products there is not any support from external third-party and you will be stuck with whatever the manufacturers can come out. Until the product creates a solid market where accessories can be profitable to give support with watch bands.

The Pixel Watch contains a last-gen processor. This can be a negative feature, but it is coming alongside with 2GB of RAM and the co-processor make that up. The battery is competitive but is not outstanding on that department.
